# 1. INTRODUCTION

## 1.1 Project Overview

IoT-based agriculture system helps the farmer in monitoring different parameters of his field like soil moisture, Temperature, humidity using some sensors. Farmers can monitor all the sensor parameters by using a web or mobile application even if the farmer is not near his field. Watering the crop is one of the important tasks for the farmers. They can make the decision whether to water the crop or postpone it by monitoring the sensor parameters and controlling the motor pumps from the mobile application itself.

## 1.2 Purpose

The smart agriculture model main aim to avoid water wastage in the irrigation **process**. It is low cost and efficient system Is shown below. It includes Node MCU, Arduino Nano, sensors like soil moisture and Dht11, solenoid valves, relays.

## **2.LITERATURE SURVEY**

### **2.2 Existing problem**

The challenges of a smart agriculture system include the integration of these sensors and tying the sensor data to the analytics driving automation and response activities. When integrated, the use of data analytics can reduce the overall cost of agriculture and contribute to higher production from the same amount of area through precise control of water, fertilizer and light. Smart methods allow for farming on smaller and more distributed lands through remote monitoring, whether indoor or outdoor. To successfully deploy a smart agriculture system, consider setting up a communications network that can integrate a limited number of sensors across a large area of farmland. This will require third-party network provisioning or setting up a private network consisting of access points and uplinks to a private backhaul network, which channels all the data traffic to centralized monitoring software or an analytics head-end system.

## **2.3 Problem Statement Definition**

The soil moisture sensor measures wetness content in the soil. The Arduino UNO microcontroller used to receive input from a various sensors and it can be controlled automatically. When soil moisture sensor goes low the water pump will be on and it exceeds defined levels of the water motor will turn off automatically. We can constantly monitor the growth of a crop using ultrasonic sensor. PIR sensor detects the motion or unusual movement in the agricultural land. This device his very helpful to the former to monitor and control environmental parameters at their field. The farmers did not go to their field, they can remotely monitor and control using cloud.

## 3.2 Ideation and Brainstorming

Introduction on Internet of Things (IoT), application of IoT in agricultural field to improve the yield and quality by reducing the cost is provided. The sensors which are used in the architecture are discussed briefly and the process of transmission of data from the agriculture field to the central system is explained. The proposed system advantages are included. In addition, open research issues, challenges, and future of IoT in agricultural field are highlighted. The concept is basically developed on an idea, where there are numerous things or objects - such as Arduino, sensors, GSM models, LCD display, etc., that are connected with the Internet. Each of the objects has a different address and is able to interact with other items. The things or objects co-operate with each other to reach a common goal. We are going to construct a smart agricultural monitoring system which can collect crucial agricultural data and send it to an IoT platform called Thing speak in real time where the data can be logged and analyzed. The logged data on Thing speak is in graphical format, a botanist or a reasonably knowledge farmer can analyze the data (from anywhere in the world) to make sensible changes in the supplied resources (to crops) to obtain high quality yield.

Smart agriculture monitoring system or simply smart farming is an emerging technology concept where data from several agricultural fields ranging from small to large scale and its surrounding are collected using smart electronic sensors. The collected data are analyzed by experts and local farmers to draw short term and long-term conclusion on weather pattern, soil fertility, current quality of crops, amount of water that will be required for next week to a month etc. We can take smart farming a step further by automating several parts of farming, for example smart irrigation and water management. We can apply predictive algorithms on microcontrollers or SoC to calculate the amount of water that will be required today for a particular agriculture field. Say, if there was rain yesterday and the quantity of water required today is going to be less. Similarly, if humidity was high the evaporation of water at upper ground level is going to be less, so water required will be less than normal, thus reducing water usage.

### 3.3 Proposed Solution

S.NO	Parameter	Description
1.	Problem Statement (Problem to be solved)	To increase production quality and quantity using IoT. Feeding a growing population, providing a livelihood for farmers, and protecting the environment.
2.	Idea / Solution description	Use modern technologies to monitor the temperature, climate changes and soil moisture control.
3.	Novelty / Uniqueness	IoT sensors can measure soil temperature, volumetric water content, photosynthetic radiation, soil water potential and soil oxygen levels.
4.	Social Impact / Customer Satisfaction	Smart farming systems improve productivity and enable management of a greater number of resources through remote sensing and reduce waste.
5.	Business Model (Revenue Model)	Farmers may easily get information about light, temperature, soil moisture, crop health etc., with the help of sensors. So the revenue increases.
6.	Scalability of the Solution	It is scalable because of the adaptability of a system to increase the capacity

## 3.4 Problem solution fit

Define CS, fit into CC	<b>1. CUSTOMER SEGMENT(S)</b> <small>Who is your customer? i.e. working parents of 0-5 y.o. kids</small>  <b>Farmers are customers</b>	<b>6. CUSTOMER CONSTRAINTS</b> <small>What constraints prevent your customers from taking action to solve their problem(s)? i.e. spending power, budget, no cash, network connection, available labour</small>  <b>1. Limited nutrient availability</b> <b>2. Inadequate crop protection</b>	<b>5. AVAILABLE SOLUTIONS</b> <small>Which solutions are available to the customers when they face the problem? We need to get the job done/ What have they tried in the past? What pros &amp; cons do these solutions have? i.e. pen and paper is an alternative to digital monitoring</small>  <b>1. Promote welfare of farmers</b> <b>2. Promote local food consumption and improve distribution</b>	Explore AS, differentiate
	<b>2. JOBS-TO-BE-DONE / PROBLEMS</b> <small>What jobs to be done (or problems) do you address for your customers? There could be more than one explore different sides</small>  <b>1. Planting, cultivating</b> <b>2. Supervising farm labor</b> <b>3. Monitoring climate conditions</b>	<b>9. PROBLEM ROOT CAUSE</b> <small>What is the real reason that the problem exists? What is the back story behind the need to do this job? i.e. Customers have to do it because of the change in requirements</small>  <b>Helps to reduce overall costs and improve the quality and quantity of products</b>	<b>7. BEHAVIOUR</b> <small>What does your customer do to address the problem and get the job done? i.e. Empty related field the right solar panel inside, calculate usage and benefits, indirectly associated customers spend less time on other things work is a Greenpeace</small>  <b>To monitor agricultural land, temperature and soil moisture</b>	
Focus on J&P, map into BE, understand RC	<b>3. TRIGGERS</b> <small>What triggers customers to act? i.e. seeing their neighbour installing solar panels, reading about a more efficient solution in the news</small>  <b>1. Loss of agricultural land</b> <b>2. Decrease in variety of crops</b>	<b>10. YOUR SOLUTION</b> <small>If you are working on an existing business, write down your current solution first. Write in the canvas, and check how much it fits reality. If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer behaviour</small>  <b>1. Improving quality of rural life</b> <b>2. Provide better irrigation facilities</b> <b>3. Invest in farm productivity</b> <b>4. Adopt and learn new technologies</b>	<b>8. CHANNELS of BEHAVIOUR</b> <b>8.1 ONLINE</b> <small>What kind of actions do customers take online? Extract online channels from #7</small>  <b>8.2 OFFLINE</b> <small>What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development</small>  <b>1. Farmers can see and manage all data and equipment using one device in real-time without going on the field</b> <b>2. Reduces dislocation and migration</b>	Focus on J&P, map into BE, understand RC
	<b>4. EMOTIONS: BEFORE / AFTER</b> <small>How do customers feel when they face a problem or a job and afterwards? i.e. less resources in conflict, in control, use it in your communication strategy &amp; design</small>  <b>1. Unavailability of good quality of seeds</b> <b>2. Poor irrigation facilities</b> <b>3. Lack of modern equipment</b>		<b>8. CHANNELS of BEHAVIOUR</b> <b>8.1 ONLINE</b> <small>What kind of actions do customers take online? Extract online channels from #7</small>  <b>8.2 OFFLINE</b> <small>What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development</small>  <b>1. Farmers can see and manage all data and equipment using one device in real-time without going on the field</b> <b>2. Reduces dislocation and migration</b>	
Identify strong TR & EM				Identify strong TR & EM

## 4.Requirement Analysis

### 4.1 Functional Requirement

FR No.	FunctionalRequirement(Epic)	SubRequirement(Story/Sub-Task)
FR-1	IoT devices	SensorsandWifimodule.
FR-2	Software	WebUI,Node-red,IBMWatson,MITapp

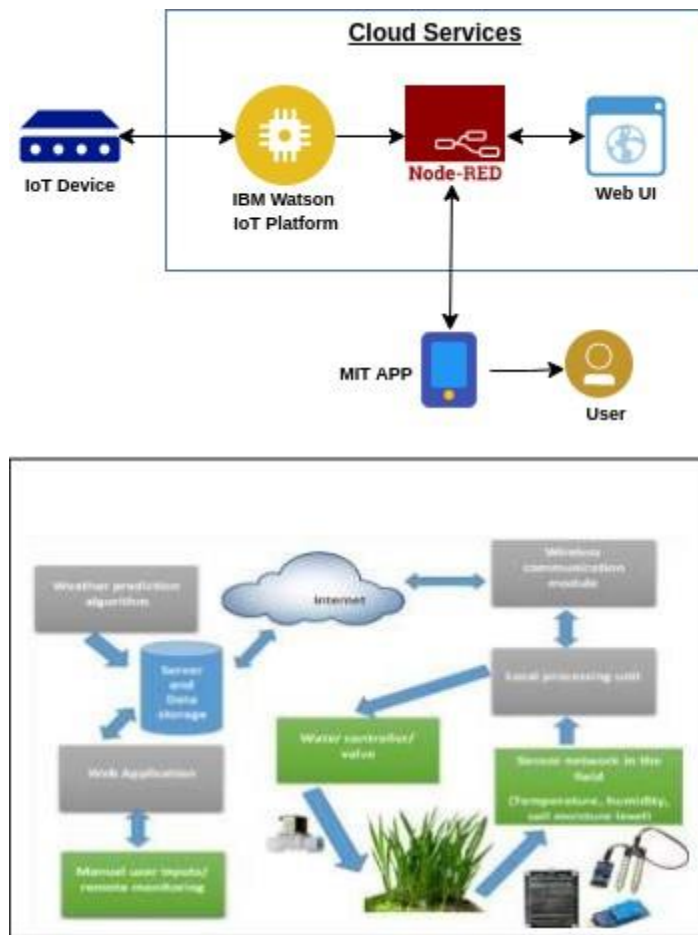

FR No.	Non-FunctionalRequirement	Description
NFR-1	<b>Usability</b>	Timeconsumabilityisless,Productivityishigh.
NFR-2	<b>Security</b>	It haslowlevelofsecurityfeaturesdueto integrationofsensor data.
NFR-3	<b>Reliability</b>	Accuracyofdataandhence itisReliable.
NFR-4	<b>Performance</b>	Performanceishighandhighly productive.
NFR-5	<b>Availability</b>	Withpermittednetworkconnectivitytheapplication is accessible
NFR-6	<b>Scalability</b>	Itisperfectlyscalablemanynewconstraintscanbe added

## **5.PRODUCT DESIGN**

### **5.1 Data flow diagrams**

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

- The different soil parameters temperature, soil moistures and then humidity are sensed using different sensors and obtained value is stored in the IBM cloud. • Arduino UNO is used as a processing Unit that process the data obtained from the sensors and whether data from the weather API.
- NODE-RED is used as a programming tool to write the hardware, software, and APIs. The MQTT protocol is followed for the communication.
- All the collected data are provided to the user through a mobile application that was developed using the MIT app inventor. The user could plan through an app, weather to water the crop or not depending upon the sensor values. By using the app they can remotely operate to the motor switch.

## 5.2 Solution and Technical Architecture

The Deliverable shall include the architectural diagram as below and the information as per the table 1 & table 2 Guidelines:

- The different soil parameters temperature, soil moistures and then humidity are sensed using different sensors and obtained value is stored in the IBM cloud.
- Arduino UNO is used as a processing Unit that process the data obtained from the sensors and whether data from the weather API.
- NODE-RED is used as a programming tool to write the hardware, software, and APIs. The MQTT protocol is followed for the communication.
- All the collected data are provided to the user through a mobile application that was developed using the MIT app inventor. The user could decide through an app, weather to water the crop or not depending upon the sensor values. By using the app, they can remotely operate the motor switch.

S.No	Component	Description	Technology
1.	User Interface	How user interacts with application e.g. Web UI, Mobile App, Chatbot etc	MIT app
2.	Application Logic-1	Logic for a process in the application	Nodered/IBM Watson/MIT app
3.	Application Logic-2	Logic for a process in the application	Nodered/IBM Watson/MIT app
4.	Application Logic-3	Logic for a process in the application	Nodered/IBM Watson/MIT app
5.	Database	Data Type, Configurations etc.	MySQL,NoSQL, etc.
6.	Cloud Database	Database Service on Cloud	IBM cloud.
7.	Temperature sensor	Monitors the temperature of the crop	
9.	Humidity sensor	Monitors the humidity	
9.	Soil moisture sensor (Tensiometers)	Monitors the soil temperature	

<b>10.</b>	Weather sensor	Monitors the weather	
<b>11.</b>	Solar panel		
<b>12.</b>	RTC module	Date and time configuration	
<b>13.</b>	Relay	To get the soil moisture data	

## 6.PROJECT PLANNING AND SCHEDULING

<b>Sprint-2</b>	User Interface	UNS-3	As a user, I can register for the application through Facebook	3	Low	B. Sardhar hussein (Member 2)
<b>Sprint-1</b>	Data Visualization	UNS-4	As a user, I can register for the application through GMAIL	2	Medium	R. Sam rahul (Member 3)

<b>Sprint-3</b>	Registration (Farmer - Web User)	USN - 1	As a user, I can log into the application by entering email and password	3	High	R. Sarathy priyan (Member 4)
<b>Sprint - 2</b>	Login	USN - 2	As a registered user, I need to easily login log into my registered account via the web page in minimum time	3	High	V.B Sindhu (Leader)
<b>Sprint - 4</b>	Web UI	USN - 3	As a user, I need to have a friendly user interface to easily view and access the resources	3	Medium	R. Snehaa (Member 1)
<b>Sprint - 1</b>	Registration (Chemical Manufacturer - Web user)	USN - 1	As a new user, I want to first register using my organization email and create a password for the account.	2	High	B. Sardhar hussein (Member 2)
<b>Sprint - 4</b>	Login	USN - 2	As a registered user, I need to easily log in using the registered account via the web page.	3	High	R. Sam rahul (Member 3)
<b>Sprint - 3</b>	Web UI	USN - 3	As a user, I need to have a user friendly interface to easily view and access the resources.	3	Medium	R. Sarathy priyan (Member 4)
<b>Sprint - 1</b>	Registration (Chemical Manufacturer - Mobile User)	USN - 1	As a user, I want to first register using my email and create a password for the account.	1	High	V.B Sindhu (Leader)

<b>Sprint - 1</b>	Login	USN - 2	As a registered user, I need to easily log in to the application.	2	Low	R. Snehaa (Member 1)

# 9.RESULTS

## 9.1 Performance Metrics

## **10. Advantages and disadvantages**

### **Advantages:**

- ✦ A remote control system can help in working irrigation system valves dependent on schedule. Irrigating remote farm properties can be exceptionally troublesome and labor intensive. It gets hard to comprehend when the valves were started and whether the ideal measure of water was distributed.
- ✦ For situations where a quick reaction is required, manual valve actuation may not be conceivable constantly. Thus, remote observing and control of irrigation systems, generators or wind machines or some other motor-driven hardware become the next logical step.
- ✦ Various solutions are available to monitor engine statistics and starting or stopping the engine. When the client chooses to begin or stop the motor, the program transmits a sign to the unit within seconds by means of a mobile phone system.
- ✦ Submersible weight sensors or ultrasonic sensors can screen the degree of tanks, lakes, wells and different kinds of fluid stockpiling like fuel and compost. The product figures volume dependent on the tank or lake geometry after some time. It conveys alarms dependent on various conditions.

### **Disadvantages:**

- † The smart agriculture needs availability of internet continuously. Rural part of most of the developing countries do not fulfil this requirement. Moreover internet connection is slower.
- † The smart farming based equipment require farmers to understand and learn the use of technology. This is major challenge in adopting smart agriculture farming at large scale across the countries.

## **11. CONCLUSION**

Farmers can benefit greatly from an IoT-based smart agriculture system. As a result of the lack of irrigation, agriculture suffers. Climate factors such as humidity, temperature, and moisture can be adjusted dependent on the local environmental variables. This technology also detects animal invasions, which are a major cause of crop loss. This technology aids in the scheduling of irrigation based on present data from the field and records from a climate source. It helps in deciding the farmer to whether to do irrigation or not to do. Continuous internet connectivity is required for continuous monitoring of data from sensors. This also can be overcome by using GSM unit as an alternative of mobile app. By GSM, SMS can be sent to farmers phone.

## **12.Future scope**

In the current project we have implemented the project that can protect and maintain the the crop. In this project the farmer monitor and control the field remotely. In future we can add or update few more things to this project

.

- We can create few more models of the same project ,so that the farmer can have information of a entire.
- We can update the this project by using solar power mechanism. So that the power supply from electric poles can be replaced with solar panels. It reduces the power line cost. It will be a one time investment. We can add solar fencing technology to this project.
- We can use GSM technology to this project so that the farmers can get the information directly to his home through SMS. This helps the farmer to get information if there is a internet issues. • We can add camera feature so that the farmer can monitor his field in real time. This helps in avoiding thefts.
